

Senior Software Engineer

About the Role

We're looking for a **Senior Software Engineer** to join our Engineering team as we continue to evolve our internal and customer-facing platform.

This is a senior engineering role with the potential to grow into technical ownership of our **Application / Platform** domain over time. The role will initially focus on core software engineering delivery, working across backend services, APIs, application architecture, integrations and product-facing workflows.

We're a small, senior Engineering team making heavy use of automation and AI coding agents to accelerate delivery. Because of that, this role is not just about writing code. We're looking for someone with strong technical judgement who can help shape implementation approaches, contribute confidently to architectural discussions, review and guide agent-assisted work, and help establish patterns that make the platform easier to build, maintain and extend.

The ideal person will be comfortable sharing their opinion in group technical discussions, while also being open-minded, pragmatic and willing to change their view when better information emerges.

About the Team

Our Engineering team works on a data-heavy B2B adtech platform that ingests and processes large volumes of data from external partners and advertising platforms.

The platform includes:

- internal and customer-facing tools
- backend APIs
- frontend applications
- data pipelines
- third-party platform integrations
- campaign reporting and delivery data
- firmographic, IP/domain and audience data
- cloud infrastructure and deployment workflows

We are moving toward a clearer domain-based operating model, with ownership across:

- **Data**

- **Infrastructure**
- **Application / Platform**
- **Technical Solutions & Delivery Readiness**

This role would sit within the **Application / Platform** domain, working closely with engineers focused on frontend/product implementation, data, infrastructure and technical solution shaping.

What You'll Be Doing

You will help build and evolve the core software application layer of the platform.

Responsibilities will include:

- designing and building backend services and APIs
- contributing to application/platform architecture
- helping define service and domain boundaries
- building integrations with third-party advertising and data platforms
- supporting product-facing workflows across backend and frontend systems
- working with Python, FastAPI, SQLAlchemy and PostgreSQL
- contributing to application-level auth, permissions and tenancy patterns
- helping shape API contracts between frontend, backend and data services
- working with AWS-hosted services and containerised applications
- supporting the move toward a more domain-oriented and agent-friendly platform
- reviewing human- and agent-generated code
- helping define engineering patterns that AI coding agents can safely follow
- working with Technical Solutions & Delivery Readiness to turn well-shaped requirements into implementation plans
- collaborating with Data and Infrastructure domain owners on cross-domain work
- contributing to technical discussions, trade-off analysis and implementation design

Over time, there is an opportunity for this person to grow into technical ownership of the **Application / Platform** domain.

What We're Looking For

We're looking for someone who is already operating at a senior level and wants to have meaningful technical influence in a small team.

You should have strong experience with:

- Python application development
- backend API design
- FastAPI or similar Python web frameworks
- PostgreSQL
- SQLAlchemy or similar ORM/data-access patterns
- service-oriented or domain-oriented application design
- building maintainable, production-grade software
- working with cloud-hosted systems, ideally AWS
- Docker/containerised development
- CI/CD and modern software delivery practices
- integrating with third-party APIs
- designing systems that are reliable, testable and easy to understand

You should also be comfortable working alongside frontend engineers and understanding how backend/API decisions affect product and user workflows.

Experience with Next.js, TypeScript or modern frontend applications is useful, but this is not primarily a frontend role.

AI-Assisted Engineering

We are making active use of AI coding agents and automation across Engineering.

This means we value people who can do more than simply produce code. We are looking for someone who can:

- use AI coding agents effectively
- provide clear context and constraints to agents
- critically review agent-generated code
- spot when generated code is superficially correct but architecturally wrong
- define patterns that make agent-assisted delivery safer
- understand when to automate and when human judgement is needed
- help the team move faster without sacrificing quality, maintainability or safety

This role will be important in helping the team get more value from AI-assisted development while maintaining strong engineering standards.

What Good Looks Like

A successful person in this role will:

- take ownership of complex backend/application work
 - contribute constructively to architecture and implementation discussions
 - bring clear technical opinions without being dogmatic
 - recognise when they are wrong or when another approach is better
 - work well with engineers across frontend, data and infrastructure
 - improve the quality and consistency of our application/platform codebase
 - help reduce reliance on informal knowledge or one-off implementation patterns
 - support agent-assisted delivery through good structure, review and standards
 - grow into a trusted technical voice within the Application / Platform domain
-

Our Current Stack

Our current and planned technology stack includes:

- Python
- FastAPI
- SQLAlchemy
- PostgreSQL
- Next.js / TypeScript
- AWS
- Docker
- Prefect for pipeline orchestration
- AI coding agents and agent-assisted development workflows

Experience with all of these is not required, but strong Python/backend experience and good architectural judgement are important.

Location and Working Pattern

We work remotely, but we are primarily looking for someone based around **Edinburgh** or within reasonable reach of Edinburgh.

The team meets in person periodically, usually in Edinburgh and/or at our London HQ once or twice a month.

The Kind of Person Who Would Thrive Here

You'll likely enjoy this role if you:

- like working in a small, senior Engineering team
 - enjoy solving ambiguous technical problems
 - are comfortable contributing to architectural discussions
 - want to help shape a platform, not just complete tickets
 - are pragmatic and delivery-focused
 - care about maintainability and long-term system quality
 - are interested in how AI and automation change software delivery
 - can balance strong opinions with humility
 - want the opportunity to grow into a domain leadership role over time
-

Summary

This is a senior engineering role for someone who wants to help shape and build the core application platform of a data-heavy B2B adtech business.

The immediate need is for strong hands-on application/platform engineering capability. Over time, the role has the potential to grow into technical ownership of the Application / Platform domain.

We're looking for someone who can combine strong backend engineering, architectural judgement, pragmatic delivery, and an interest in using AI-assisted workflows to help a small team move faster without losing coherence or quality.
